

HPV TEST RESULT

Dear

You sent us a sample for detecting the HPV virus.

The sample you sent in yielded for the **second time no result**. Again, the quality of the sample was not good enough. We could not investigate whether you are infected with the virus. This could be for a variety of reasons and is not necessarily down to how you collected the sample. No need to worry. This does not mean that something has gone wrong with the process.

But we do recommend that you get additional examinations.

| What should you do now?

- Make an appointment with your GP or gynaecologist. They have also received the result of this trial.
- Pick a day when you don't have your period.
- Your GP or gynaecologist will make a **smear**¹ for further investigation.
- In the swab, we can see if there are any abnormal cells on the cervix. Abnormal cells can turn into a precursor of cervical cancer. Checking in time is very important.

Your GP has also received the result of this trial.

| Do you have a question?

- Call you **GP or gynaecologist**.
- Go to **www.ScreenUrSelf.be**. You will also find a translation into French, English, Turkish, Arabic, Polish, Romanian and Russian of this letter.
- Call free on **0800 60 160** (9-12am and 1-4pm) or email info@bevolkingsonderzoek.be.

With best regards,

Prof. Dr. Pierre Van Damme

Principal investigator of the ScreenUrSelf trial, Antwerp University

¹ Has it been more than three years since you had a smear test? If so, you will get a full refund of the cost of the smear test. You will then only have to make the co-payment for the appointment with your GP. Did you receive an invoice from the lab anyway? Contact your health insurer.
