## Introduction

- Alcoholic liver disease (ALD) is highly prevalent but poorly identified and characterized with lack of sensitive and specific early biomarkers for ALD
- Excessive alcohol consumption leads to progressive intracellular lipid accumulation resulting in alcoholic fatty liver disease
- As metabolic alterations are reflected in the phenotype and vice versa, metabolomics can help to identify early-stage indicators of alcoholic fatty liver disease

## Objectives

- Mechanistic elucidation of ethanol-induced hepatotoxicity at the cellular level using the human HepaRG liver cell line
- Generation of hypotheses on the mechanism of action of ALD
- Showcase potential diagnostic biomarkers for early ALD

## Approach

### Exposure conditions

- 1 x 10<sup>6</sup> HepaRG cells per sample
- 7 days of incubation to develop co-culture of hepatocyte-like cells and biliary-like cells
- 4 sample groups
  - Exposure to ethanol at IC<sub>10</sub> (n = 6)
  - Exposure to ethanol at 1/10 of IC<sub>10</sub> (n = 6)
  - Unexposed controls (n = 6)
  - Extraction blanks (n = 2)
- 2 exposure times
  - 24 h and 48 h
- 2 sample types
  - Intracellular and extracellular extracts were harvested
- 2 batches
  - Entire experimental set-up was repeated for validation of metabolomics results

### LC-MS based metabolomics

#### Apolar extracts

- RPLC-ESI-DTIM-QToF-HRMS (Agilent 6560)
- UPLC BEH C18 column in ESI+ and ESI-
- Drift tube ion mobility to increase annotation confidence

#### Polar extracts

- HILIC-ESI-QToF-HRMS (Agilent 6530)
- iHILIC-Fusion column in ESI+
- iHILIC-Fusion(P) column in ESI-

#### Worklist

- System suitability
- Conditioning
- Random injection order
- QC<sub>pooled</sub> at regular intervals
- Samples in MS1
- QC in MS1/MS2/DTIM
- Iterative exclusion DDA

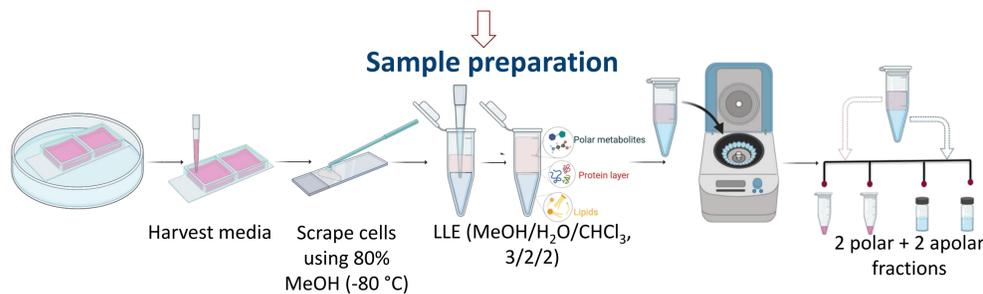

### Data processing

#### Preprocessing and pretreatment

- Peak picking & alignment
- Deisotoping, duplicate removal & drift correction
- Filtering (e.g. mRSD < 30%)
- Random forest imputation
- Log transformation
- PQN normalization
- Pareto scaling

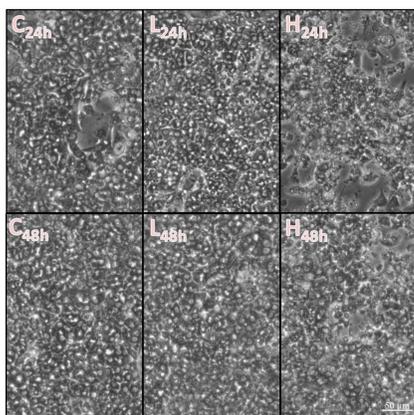

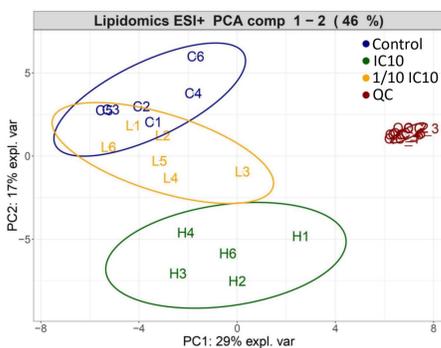

#### Statistics and annotation

- PLS-DA & random forest binary classifier -VIP > 1 & MDA > 0.1
- Mann-Whitney U – Student t -p < 0.05 & FC > 5 | < 0.2
- Boxplots to confirm feature importance
- MS-DIAL, MS-Finder, MassBank, NIST, METLIN, GNPS, LipidMatch, LipidHunter for annotations & manual confirmation

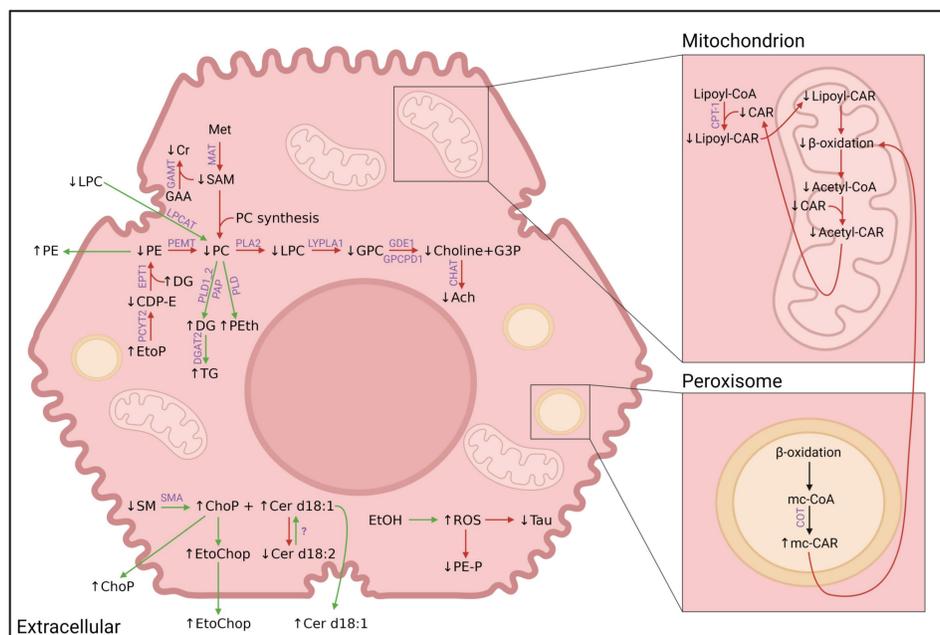

## Results and Discussion

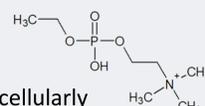

### PCA and microscopic evaluation

- PCA plots indicate strong metabolic impact of ethanol exposure
  - Clear separation IC<sub>10</sub> (H) – CTL (C)
  - More overlap 1/10 IC<sub>10</sub> (L) - C
  - Morphological differences C - H
  - Faded lining polarized hepatocyte colonies
  - Impaired organization of hepatic clusters & accumulated debris
  - No clear morphological differences C - L

- 94 altered intracellular metabolites & 23 altered extracellular metabolites
- ↓PC: ↓formation due to ↓conversion from PE and ↓methyl transfer due to ↓SAM, ↑consumption for production of PEth, DG and subsequent TG
- ↓LPC & GPC: ↓PC catabolism and ↑intrahepatic LPC uptake for compensation
- ↓PE: corresponds to ↑precursors EtOP and DG, ↑extracellular PE due to ↑secretion
- ↑SM: ↑hydrolysis to ChOP and Cer (d18:1)
- ↓Cer (d18:2): unknown mechanism
- ↑medium chain CAR: incomplete oxidation products of peroxisomal β-oxidation can not be processed by impaired mitochondrial β-oxidation
- Ethoxylated phosphorylcholine (EtoChoP) might be a new marker of ethanol exposure
  - Absence in control samples
  - Similar fold change as PEth 16:0\_18:1
  - Unlike PEth 16:0\_18:1, EtoChoP was found intra- and extracellularly

### Intracellular sample fraction

Species	High dose 24h exposure	Low dose 24h exposure	High dose 48h exposure	Low dose 48h exposure
Acetylcholine	High	Low	High	Low
Creatine	High	Low	High	Low
Glycerophosphocholine	High	Low	High	Low
Short chain acylcarnitines	High	Low	High	Low
Medium chain acylcarnitines	High	Low	High	Low
O-phosphoethanolamine	High	Low	High	Low
Pantothenic acid	High	Low	High	Low
Phenylacetylglutamine	High	Low	High	Low
5-adenosylmethionine	High	Low	High	Low
Ethoxylated phosphorylcholine	High	Low	High	Low
Taurine	High	Low	High	Low
Ceramides (d18:2)	High	Low	High	Low
Lysophosphatidylcholines	High	Low	High	Low
Lysophosphatidic acids	High	Low	High	Low
Phosphatidylcholines (< 5 DB)	High	Low	High	Low
Phosphatidylcholines (> 5 DB)	High	Low	High	Low
Ether phosphatidylcholines	High	Low	High	Low
Phosphatidylethanolamines	High	Low	High	Low
Ether phosphatidylethanolamines	High	Low	High	Low
Vinyl ether phosphatidylethanolamines	High	Low	High	Low
Phosphatidylethanolols	High	Low	High	Low
Phosphatidylglycerol	High	Low	High	Low
Sphingomyelins	High	Low	High	Low
Dialcylglycerols	High	Low	High	Low
Triacylglycerols	High	Low	High	Low

### Extracellular sample fraction

Species	High dose 24h exposure	Low dose 24h exposure	High dose 48h exposure	Low dose 48h exposure
Alanine	High	Low	High	Low
Glutamine	High	Low	High	Low
Histidine	High	Low	High	Low
Phenylacetylglutamine	High	Low	High	Low
Beta-alanine	High	Low	High	Low
Ethoxylated phosphorylcholine	High	Low	High	Low
Phosphorylcholine	High	Low	High	Low
N-acetyl-lactosamine	High	Low	High	Low
Glycerophosphocholine	High	Low	High	Low
Inosine	High	Low	High	Low
4-pyridoxic acid	High	Low	High	Low
20-dihydrocortisol	High	Low	High	Low
Hypoxanthine	High	Low	High	Low
Ceramides (d18:1)	High	Low	High	Low
Lysophosphatidylcholines	High	Low	High	Low
Phosphatidylethanolamines	High	Low	High	Low

### Conclusions

- Minor effect of exposure time
- Major effect of exposure concentration
- Multiple altered metabolites consistent with steatotic image
- Cer (d18:2), Cr, EtOP, Ach and medium chain CAR as additional markers of toxicity
- EtoChoP is a potential new marker of ethanol exposure
