Dr. Alessandro Za, MD, MPH

# Deaths related to cancer in DRC: 2014

- High HPV-HR infection rate
- No HPV vaccinations
- No screening programs.

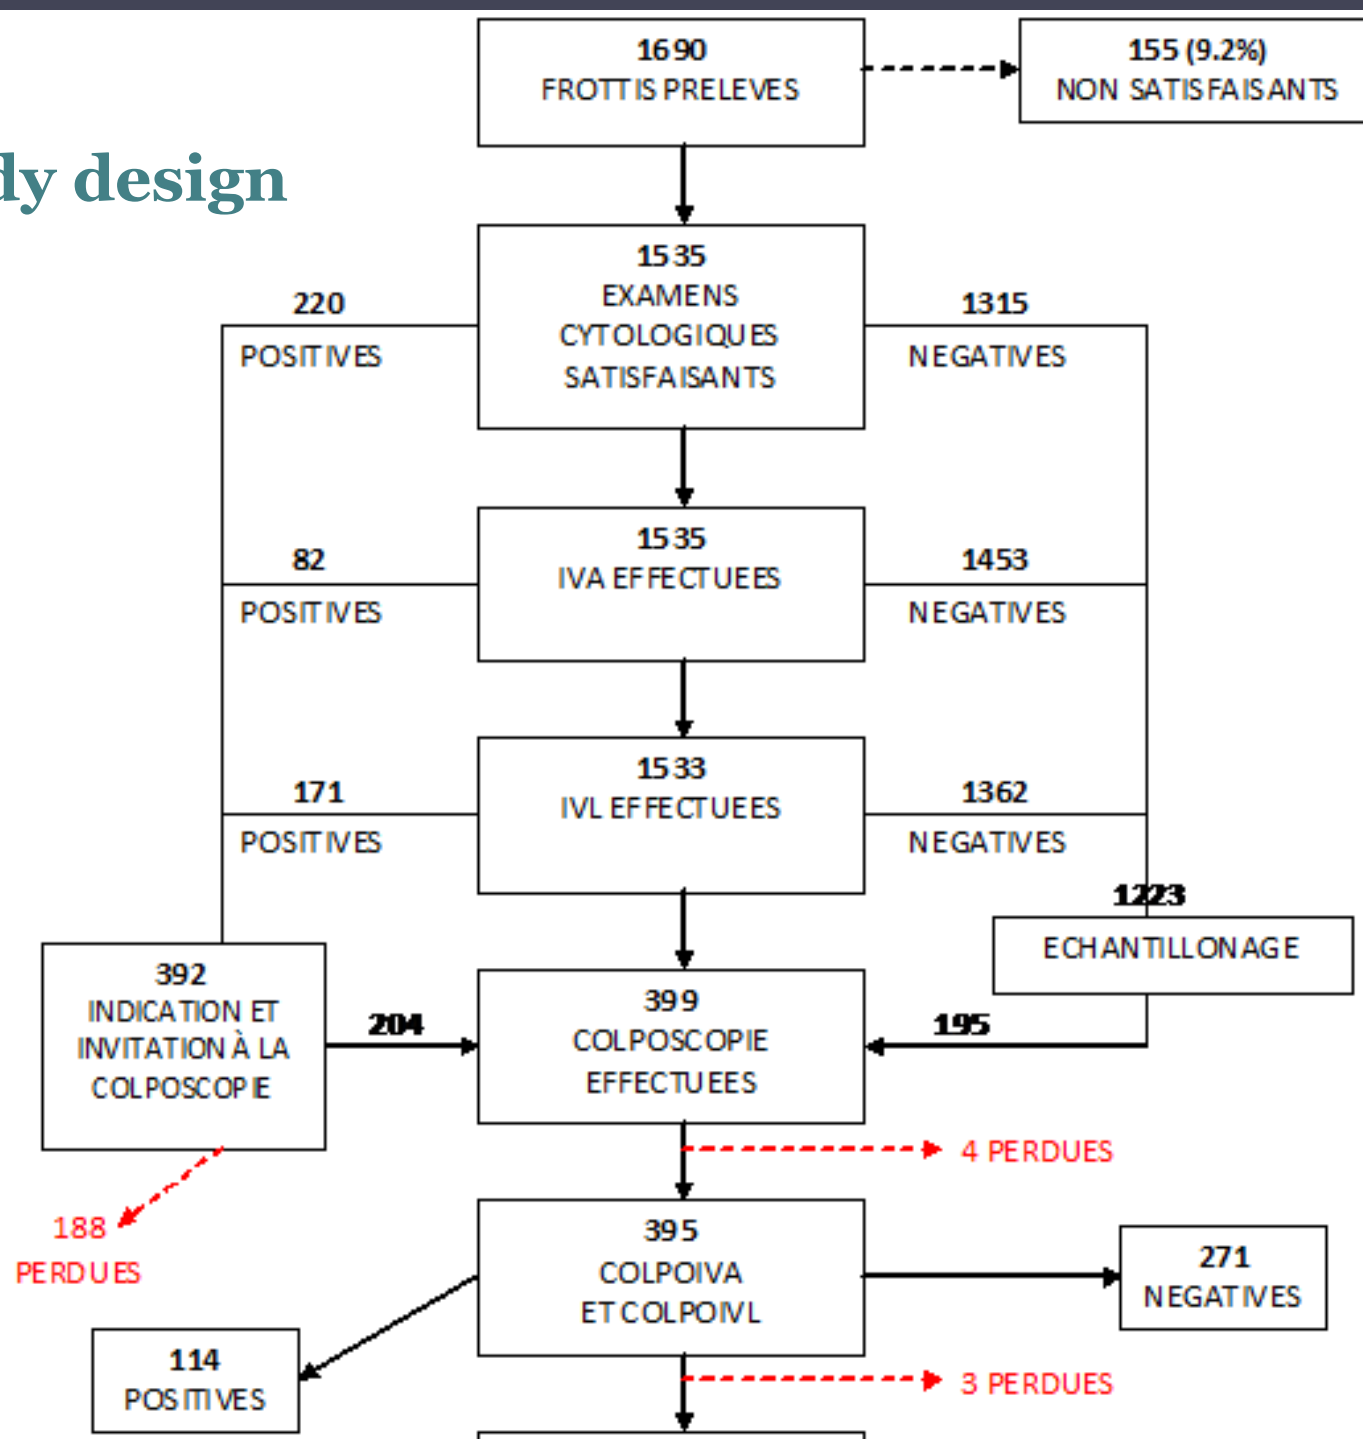

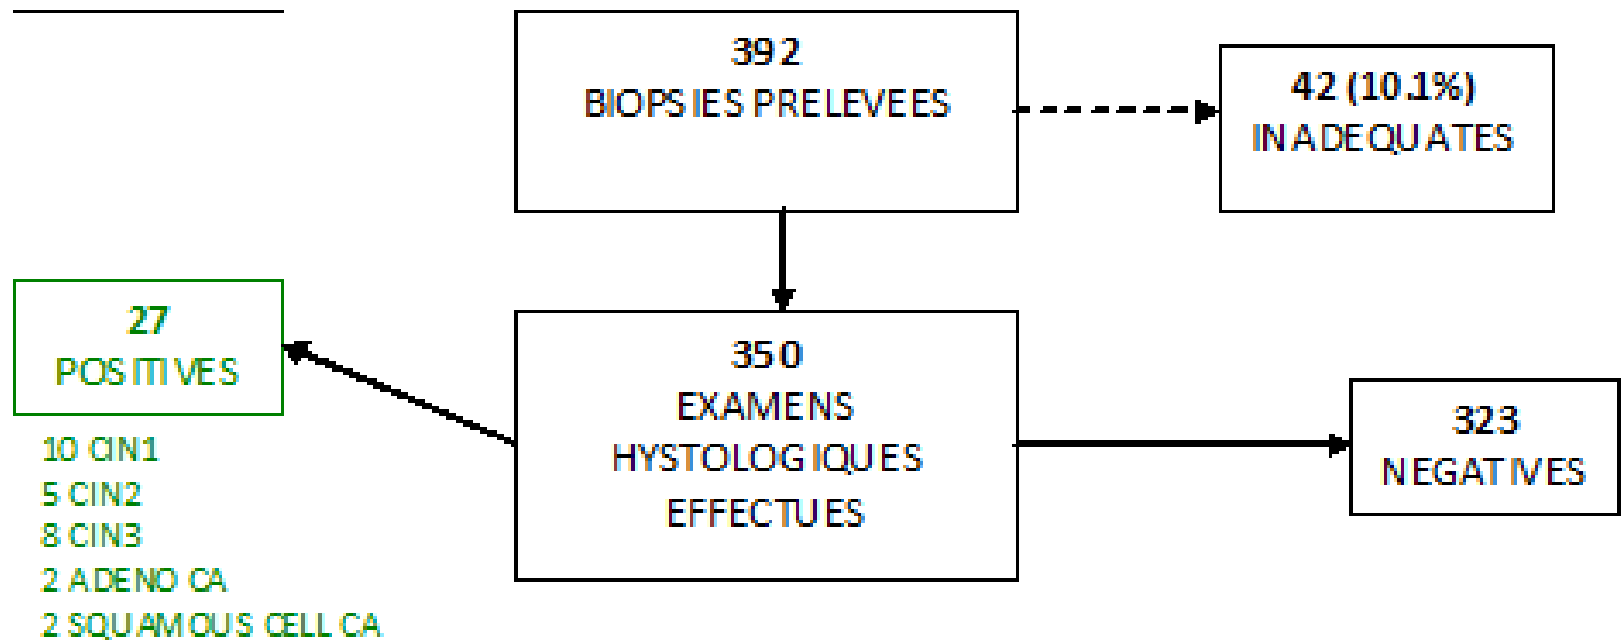

## Rationale and Objectives of the study

- National strategy for early detection and treatment of pre-cancerous lesions is lacking
- Cytology based screening is expensive
- VIA/VILI would be an affordable alternative
- Studies show variable results

*Validate affordable, feasible diagnostic tools to propose a rational, evidence based screening strategy for the context of the DRC*

# Study design

# Screening tests performances

	<b>PAP SMEAR % c.i.95%</b>	<b>IVA % c.i.95%</b>	<b>IVL % c.i.95%</b>
SENS	<b>55.5 %</b> (37.3, 72.4)	<b>18.5 %</b> (8.1, 36.7)	<b>33.3 %</b> (18.6, 52.1)
SPEC	<b>80.5 %</b> (75.8, 84.4)	<b>87.3 %</b> (83.2, 90.5)	<b>72.9 %</b> (67.8, 77.5)
VPP	<b>19.2 %</b> (12.0, 29.3)	<b>10.8 %</b> (4.7, 23.0)	<b>9,3 %</b> (5.0, 16.8)
VPN	<b>95.5 %</b> (92.4, 97.4)	<b>92.7 %</b> (89.2, 95.1)	<b>92.8 %</b> (89.0, 95.4)

## Cost effectiveness

Test	Unit Price	Sensitivity	Cost effectiveness /test
IVA	5,05	16,13	31,31
IVL	5,06	32,26	15,69
IVA+IVL	10,11	38,71	26,12
Pap smear	15,32	55,56	27,57

## Conclusions Phase I

- Cervical Cancer Screening is feasible in DRC
- VIA = simple method but not sensitive and poor positive predictive value
- Papanicolau: best results but logistically heavy, most cost-effective

## Recommendations

- Papanicolau smear as screening test
- Technical plateau needed to enhance knowledge in cytology
- VIA: although simple method, demands prolonged training
- More reflection needed to establish a sensibilisation, screen and treat model which is feasible and effective in the DRC

# Implementation of Cervical Cancer Screening in Kinshasa (Phase II)

## **4 Sites:**

- Binza Ozone
- Kisangani
- Matete
- Lemba

## **Multidisciplinary team:**

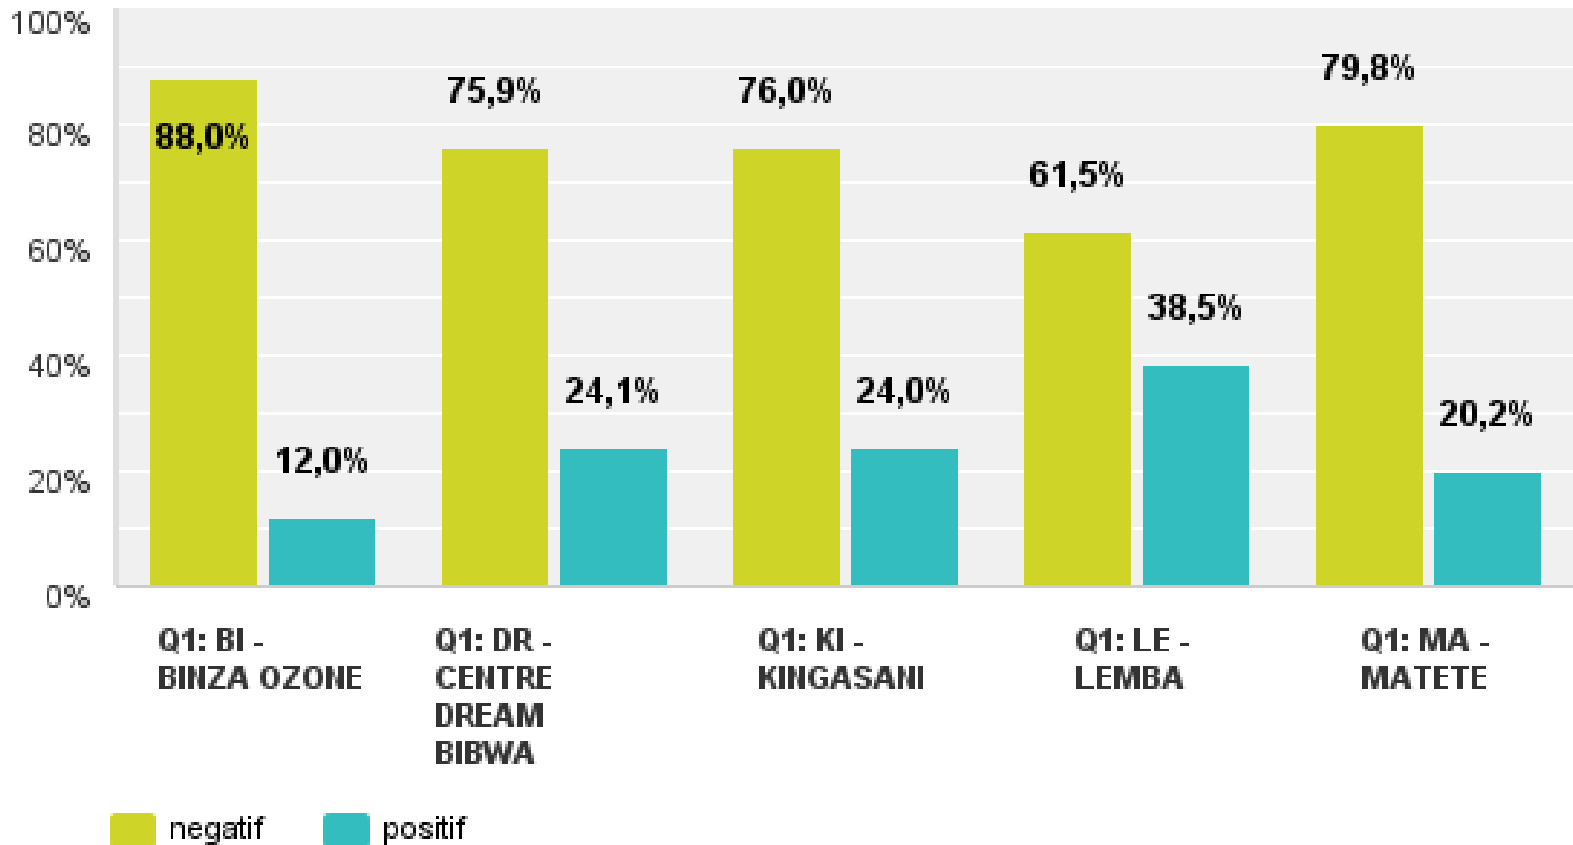

- Coordinators
- Medical doctors
- Nurses
- Cytotechnicians
- Anatomopathologists

## **Approach:**

- Using Health facility human resources
- One day a week is dedicated to screening activities (pap smear/ VIA/ VILI)
- Monitoring and supervision
- Technical support based on local expertise

## Q8 VIA

Hanno risposto: 993 Hanno saltato la domanda: 18

Huge differences in IVA performances for the different centers

# Pap-smear and VIA results

PAP SMEAR RESULTS	IVA negatif	IVA positif	TOTAL
négatif,	434	154	<b>590</b>
Low grade	40	10	<b>50</b>
Ascus,	9	3	<b>12</b>
ASC-H,	6	5	<b>11</b>
SIL, High grade SIL,	5	4	<b>9</b>
modification cellulaires réactives,	4	1	<b>5</b>
Squamous cell carcinoma,	0	1	<b>1</b>
AGC + neoplastic atypical glandular cells	0	0	<b>0</b>
<b>TOTAL</b>	<b>498</b>	<b>178</b>	<b>678</b>

Of course not possible to compare, because the gold standard is biopsy. But there is material of reflection...the modelling should continue for a while before deciding a strategy.

## Conclusion and Take home message

- VIA performance is strongly dependant to the operator
- Inter-person variability is abundant
- Could be solved by stronger training?
  
- Pap smear is the test that seems to be the most reliable in the context of the DRC
- Need for heavy logistics but feasible

Thank you for your attention
